VISUAL GENERATION

One visit. Then nothing.

660,000 women give birth in France every year. After the first postpartum check-up, the system goes quiet. Mood, recovery, and bonding all happen unsupervised.

660K Births in France per year (Insee, 2024)

1 in 5 Women develop postpartum depression (Santé publique France)

50% Of those cases are never diagnosed (HAS, 2023)

STRUCTURAL, NOT OPTIONAL

The gap is structural. It is fixable.

OUR SOLUTION

A protocol-bound voice companion for the entire maternal journey.

Nine clinical states from positive test to twelve-month recovery. One short voice check-in per state, classified in real time as green, yellow, or red. Red routes straight to a clinician with a structured handoff. Every turn is auditable.

01 Protocol, not improvisation

A YAML state machine owns the conversation. The model speaks inside guardrails, not over them.

02 Voice-first by design

Mothers do not type at 4am. They speak. We meet them where they are, hands free, low friction.

TECHNOLOGY PARTNERS

SLNG

Global voice transport. Low-latency turn taking, session orchestration, telephony in and out.

Gradium

Speech-to-text and text-to-speech. Multilingual, ffmpeg-friendly, EU-hosted option.

OpenAI

Structured-output dialogue engine. Strict JSON schema, no free-form drift.

Tavily

Clinical retrieval. Verified search and extraction when the assistant needs a public protocol.

Fastino Pioneer

Small task-tuned patient model. French maternal vocabulary head, on-device option.

fal

Generative media. Patient-facing visual assets and clinician dashboards.

ARCHITECTURE: PROTOCOL OWNS STATE. MODEL SPEAKS. VOICE CARRIES.

WHY THIS, WHY NOW

The next million mothers *will not be alone.*

Voice models finally sound human. Guardrail engineering finally catches up. Postpartum care has waited a generation for this combination. We are building it.

MARKET

660K / yr

Births in France. 5M+ across EU. Every one of them is a 12-month opportunity for follow-up care, not a single discharge note.

WEDGE

PPD detection

Postpartum depression. One in five develop it, half are never diagnosed. Voice catches mood drift weeks earlier than the standard check-up.

MOAT

Protocol IP

Nine clinical states, auditable guardrails, clinician handoff format. The model is interchangeable. The protocol is not.

We are looking for clinical partners, a pilot
